8.4 – Collisions

Elastic – Deformation occurs during collision, but objects spring back into shape afterwards.
Ex: Gas molecules, billiard balls.

Inelastic – Deformation occurs, but doesn’t reverse as objects spring apart.
Objects might stick together.
Ex: Crashing cars, clay thrown at a wall, bumper cars.

Types of Collisions

Momentum and Energy:
Elastic Collisions
Momentum and kinetic energy are conserved.

\[ P_1 = P_2 \]
\[ K_1 = K_2 \]

Newton’s Cradle demo; track cradle demo.

Velocity of Elastic Collisions
Final velocities of elastic collisions:

Object 1:
\[ v_1 = \left( \frac{m_1 - m_2}{m_1 + m_2} \right) v_0 + \frac{2m_2}{m_1 + m_2} v_{0i} \]

Object 2:
\[ v_2 = \left( \frac{2m_1}{m_1 + m_2} \right) v_0 - \frac{m_1 - m_2}{m_1 + m_2} v_{0i} \]

These can be used for any two objects, but simplify if one is initially resting.
Depending on masses, objects can bounce backwards or be propelled forward with greater speed.

Massive Incoming Object
Consider a really massive ball hitting a much lighter resting one.
\[ m_1 >> m_2: \]
\[ v_1 \approx v_{0i} \text{ and } v_2 \approx 2v_{0i} \]
Bowling ball vs golf ball demo.

Light Incoming Object
Consider a really light ball hitting a much heavier resting (or moving) one.
\[ m_1 << m_2: \]
\[ v_1 \approx -v_{0i} \text{ and } v_2 \approx 0 \]
Golf ball vs. bowling ball demo.
Momentum and Energy: Inelastic Collisions

Momentum is conserved, NOT kinetic energy.

Imagine two clay blobs with equal momentum colliding and sticking.

Net momentum was zero before, and zero afterward. Kinetic energy was positive, now is zero: sound, frictional heat expend energy.

\[ K_f < K_i \]

1. Inelastic Example

A 5.4 kg lump of clay traveling 8.0 m/s collides with a stationary 3.5 kg lump and sticks to it. How fast is the lump traveling after the collision?

\[ P_1 = P_2 \]

\[ P_1 = m_1v_1 + m_2v_2 = 5.4 \text{ kg} \cdot 8.0 \text{ m/s} + 0 \text{ kg} \cdot \frac{m}{s} = 43.2 \text{ kg} \cdot \frac{m}{s} \]

\[ P_1 = P_2 = (m_1 + m_2)v_2 \]

\[ v_2 = \frac{P_1}{m_1 + m_2} = \frac{43.2 \text{ kg} \cdot \frac{m}{s}}{5.4 \text{ kg} + 3.5 \text{ kg}} = \frac{4.9 \text{ m}}{s} \]

2. Inelastic Example

A 6.2 kg blob traveling 7.5 m/s along the positive x-axis collides and sticks to a 4.5 kg blob going towards it at 14 m/s. What is the velocity afterwards?

\[ P_1 = P_2 \]

\[ P_1 = m_1v_1 + m_2v_2 = 6.2 \text{ kg} \cdot 7.5 \text{ m/s} + 4.5 \text{ kg} \cdot (-14 \text{ m/s}) = -16.5 \text{ kg} \cdot \frac{m}{s} \]

\[ P_1 = P_2 = (m_1 + m_2)v_2 \]

\[ v_2 = \frac{P_1}{m_1 + m_2} = \frac{-16.5 \text{ kg} \cdot \frac{m}{s}}{6.2 \text{ kg} + 4.5 \text{ kg}} = \frac{-1.5 \text{ m}}{s} \]
